

Nordic Water Products AB have on the 29th of February, acquired all shares in the Norwegian company Soby Miljøfilter AS

Soby Miljøfilter, based just outside Bergen in Norway, has developed its band filter since more than 25 years with focus on municipal and industrial applications.

The band filter is widely used in Norway as a replacement for traditional primary sedimentation tanks, as well as the only filter on primary treatment plants, giving more than 50 % reduction in SS and 20% reduction in BOD. It is also widely used in industrial applications as well as a screen in MBR treatment plants.

The interest of using micro screening instead of, or as a complement to, traditional primary treatment is growing fast worldwide. In Norway, where this technology has been developed since the last 25 years, it has shown huge savings in investment costs and space requirement. With the acquisition of Soby, Nordic Water will gain, not only technology, but the application knowledge, experience and references needed to take this technology internationally.

The band filter is complementing technology to Nordic Water's Microfiltration technology Dynadisc and Dynadrum, and will create a unique offering to Nordic Water's customers.
